Introduction

Problem

- Lymph node involvement
- Tumor heterogeneity
- Metastasis
- Post-surgical recurrence risk
- Over /under staging

A. Data processing

B. Marker screening

C. Stage feature screening

D. Machine learning model

Expected results

Improved accuracy in staging and diagnosis

- Random forest best perform colon and cancer staging diagnosis
- Accuracy of colon diagnosis >98% [3]

Predicting recurrence risk and survival

- Predict recurrence risk (gene expression profiles) stage II and III [4]

Identify biomarker

- Colon cancer prognosis associated genes

- ML screens new biomarker genes which enhances cancer treatment and targeted therapies.
- Enhanced ML model provides accurate diagnostic cancer staging.
